Standard of Japan Electronics and Information Technology Industries Association

1.5V±0.1V (normal range) and 0.9V to 1.6V (wide range) power supply voltage and interface standard for non-terminated digital integrated circuits

Foreword To provide this standard of specification for uniformity, multiplicity of sources, elimination of confusion, and ease of device specification and design by users.

1. Scope This standard defines power supply voltage ranges, DC interface parameters for a family of non-terminated digital circuits operating from a power supply of 1.5V and driving/driven by parts of the same family, or mixed families which comply with the input/output interface specifications.

The specifications in this standard represent a minimum set or "base line" set of interfaces for CMOS-compatible circuits. Also allow limited interoperability with EIA/JESD8-6 compliant HSTL devices.

- 2. Standard specifications All voltages listed are referenced to ground except where noted.
- **2.1 Absolute maximum continuous ratings** Absolute maximum continuous ratings give in table 1.

| Parameter | Symbol | Test condition | Rating | Unit |
|---------------------------|------------------|---|--|------|
| Power supply voltage | V_{DD} | _ | − 0.5 ~ 2.0 | V |
| DC input voltage | V_{IN} | excluding I/O pins | $-0.5 \sim V_{DD} + 0.5 (\le 2.0 \text{ max})$ | V |
| DC output voltage | V _{OUT} | including I/O pins | $-0.5 \sim V_{DD} + 0.5 (\le 2.0 \text{ max})$ | V |
| DC input current | I_{IN} | $V_{IN} < 0V$ or $V_{IN} > V_{DD}$ | ±20 | mA |
| DC output current | I _{OUT} | $V_{OUT} < 0V \text{ or } V_{OUT} > V_{DD}$ | ±20 | mA |
| Storage temperature range | T_{STG} | _ | (²) | °C |

Table 1 Absolute maximum continuous ratings (1)

Note(1): Absolute maximum continuous ratings are those values beyond which damage to the device may occur. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability. Functional operation under absolute maximum conditions is not implied, if it is beyond recommended operating conditions.

Note (2): Specified by manufacturer for various purposes, respectively.

2.2 Recommended operating conditions

2.2.1 Normal range Normal range of recommended operating conditions give in table 2.

Table 2 Normal range of recommended operating conditions

| Parameter | Symbol | Operating range | Unit |
|-----------------------------|-------------|-----------------|------|
| Power supply voltage | $V_{ m DD}$ | 1.4 ~ 1.6 | V |
| Operating temperature range | Ta | (3) | °C |

Note(³): Specified by manufacturer for various purposes, respectively.

2.2.2 Wide range Wide range of recommended operating conditions give in table 3.

Table 3 Wide range of recommended operating conditions

| Parameter | Symbol | Operating range | Unit |
|-----------------------------|-------------------|------------------|------|
| Power supply voltage | V_{DD} | 0.9 ~ 1.6 | V |
| Operating temperature range | Ta | (⁴) | °C |

Note(4): Specified by manufacturer for various purposes, respectively.

- **2.3 DC specifications** All voltages listed are referenced to ground except where noted.
- **2.3.1** Normal range of DC specifications give in table 4.

Table 4 Normal range of DC specifications(⁵)

| Parameter | Symbol | Test condition | Min | Max | Unit |
|---------------------------|-------------------|---|--------------|----------------------|------|
| Power supply voltage | V_{DD} | - | 1.4 | 1.6 | V |
| High-level input voltage | V_{IH} | V _{OUT} ≥V _{OH} (min) | $0.65V_{DD}$ | V _{DD} +0.3 | V |
| Low-level input voltage | V_{IL} | V _{OUT} ≤V _{OL} (max) | -0.3 | $0.35V_{DD}$ | V |
| High-level output voltage | V_{OH} | $I_{OH} = -2mA$ | $0.75V_{DD}$ | - | V |
| Low-level output voltage | V_{OL} | $I_{OL} = 2mA$ | - | $0.25V_{DD}$ | V |

Note(5): V_{DD} of the sending and receiving devices must track within 0.1 V to maintain adequate dc margins.

2.3.2 Wide range Wide range of DC specifications give in table 5.

Table 5 Wide range of DC specifications(6)

| Parameter | Symbol | Test condition | Min | Max | Unit |
|---------------------------|-------------------|---|----------------------|----------------------|------|
| Power supply voltage | V_{DD} | - | 0.9 | 1.6 | V |
| High-level input voltage | V_{IH} | V _{OUT} ≥V _{OH} (min) | $0.7V_{DD}$ | V _{DD} +0.3 | V |
| Low-level input voltage | $V_{\rm IL}$ | V _{OUT} ≤V _{OL} (max) | -0.3 | $0.3V_{DD}$ | V |
| High-level output voltage | V_{OH} | $I_{OH} = -100 \mu A$ | V _{DD} -0.2 | - | V |
| Low-level output voltage | V_{OL} | $I_{OL} = 100 \mu A$ | - | 0.2 | V |

Note(6): V_{DD} of the sending and receiving devices must track within 0.1 V to maintain adequate dc margins.

- **2.4 Optional DC electrical characteristics for Schmitt trigger operation** All specifications in the following tables apply across the operating temperature range.
- **2.4.1 Optional Schmitt trigger operation Normal range** Normal range of optional schmitt trigger operation give in table 6.

Table 6 Normal range of optional schmitt trigger operation (7)(8)

| Symbol | Parameter | Test Condition | Min | Max | Unit |
|--------------------|-------------------------------------|---|----------------------|--------------|------|
| V_{DD} | Supply Voltage | _ | 1.4 | 1.6 | V |
| $V_{t}+(V_{p})$ | Positive Going Threshold Voltage | V _{OUT} ≥V _{OH} (min) | $0.4V_{\mathrm{DD}}$ | $0.7V_{DD}$ | V |
| $V_{t^{-}}(V_{n})$ | Negative Going Threshold Voltage | V _{OUT} ≤V _{OL} (max) | $0.3V_{DD}$ | $0.6V_{DD}$ | V |
| $V_h (V_t)$ | Hysteresis Voltage | V_{t^+} - V_{t^-} | $0.1V_{DD}$ | $0.4V_{DD}$ | V |
| V _{OH} | Output High Voltage | $I_{OH} = -2mA$ | $0.75V_{DD}$ | _ | V |
| V _{OL} | Output Low Voltage | I _{OL} = 2mA | _ | $0.25V_{DD}$ | V |

Note(7): V_{DD} of the sending and receiving devices must track within 0.1 V to maintain adequate dc margins.

Note(8): For V_{t} + (V_{p}) and V_{t} - (V_{n}), V_{DD} refers to the receiving device. For V_{OH} and V_{OL} , V_{DD} refers to the sending device.

2.4.2 Optional Schmitt trigger operation – Wide range Wide range of optional schmitt trigger operation give in table 7.

Table 7 Wide range of optional schmitt trigger operation (9)(10)

| Symbol | Parameter | Test Condition | Min | Max | Unit |
|--------------------|-------------------------------------|---|---------------|--------------|------|
| V_{DD} | Supply Voltage | _ | 0.9 | 1.6 | V |
| $V_{t}+(V_{p})$ | Positive Going Threshold Voltage | V _{OUT} ≥V _{OH} (min) | $0.35V_{DD}$ | $0.75V_{DD}$ | V |
| $V_{t^{-}}(V_{n})$ | Negative Going Threshold Voltage | V _{OUT} ≤V _{OL} (max) | $0.25V_{DD}$ | $0.65V_{DD}$ | V |
| $V_h (V_t)$ | Hysteresis Voltage | V_{t} + - V_{t} - | $0.1V_{DD}$ | $0.5V_{DD}$ | V |
| V _{OH} | Output High Voltage | $I_{OH} = -100 \mu A$ | V_{DD} -0.2 | _ | V |
| V_{OL} | Output Low Voltage | $I_{OL} = 100 \mu A$ | _ | 0.2 | V |

Note(⁹): V_{DD} of the sending and receiving devices must track within 0.1 V to maintain adequate dc margins.

Note(10): For V_t + (V_p) and V_t - (V_n), V_{DD} refers to the receiving device. For V_{OH} and V_{OL} , V_{DD} refers to the sending device.

3. Test conditions

- **3.1** Positive Going Threshold Voltage $[V_t+(V_p)]$ Input signal is raised from a grand level in the measurement circuit shown in Figure 1 , and the input voltage value of which output logic changed is determined as $V_t+(V_p)$.
- **3.2** Negative Going Threshold Voltage[V_t (V_n)] Input signal is dropped from a power supply voltage level in the measurement circuit shown in Figure 1 , and the input voltage value of which output logic changed is determined as V_t (V_n).

Explanation for 1.5V±0.1V (normal range) and 0.9V to 1.6V (wide range) Power supply voltage and interface standard for non-terminated digital integrated circuits

This explanation is not part of this JEITA standard. The discussion that follows provides descriptions of items defined or detailed in the standard body or in the Annex as well as other related topics.

1. Purpose of establishment This standard is enacted to accomplish a high speed and a low voltage operation of digital integrated circuits.

This standard defines power supply voltage ranges, DC interface parameters for a family of non-terminated digital circuits operating from a power supply of 1.5V and driving/driven by parts of the same family, or mixed families which comply with the input/output interface specifications.

2. Review of discussion history JEDEC JC-16 (Low Voltage & High Speed Interface Sub-committee), called JEDEC after here, which belongs to EIA (Electronic Industries Alliance) in U.S.A, enacted substantially the standard of power supply voltage for digital circuits in the world.

IC Low Voltage Operation Sub-committee which belongs to EIAJ (Electronic Industries Association of Japan) has been cooperation with JEDEC and communicated mutually, since it was founded in 1992.

A power supply voltage of digital circuits had been kept 5V, actually for a long time from 1980's. But, in 1990's, a demand of low power supply voltage has become increasing to attain a low power consumption and a high noise immunity of electric equipment, in a main application of portable equipment (note PC, etc) which need a long battery operation and high performance equipment (WS, etc) which require a high speed. In 1990's, also an age of deep sub-micron process technology (below 0.5µm process technology) has begun. Needs of low power supply voltage have become the most important issue to obtain a keeping of reliability and continuities of the trends of high density, high speed, together.

According to above back ground, discussion for standard of low power supply voltage, firstly 3.3V, have begun in JEDEC, from early of 1990's. 3.3V standard (JESD8-A) was enacted in June 1994, 2.5V standard (JESD8-5) was in October 1995 and 1.8V standard (JESD8-7) was in February 1997, respectively.

EIAJ(IC Low Voltage Operation Sub-committee) began the discussion for standard of low power supply voltage since April 1996, according to JEDEC's activities of power supply discussion, in anticipation of a real popularization of 3.3V power supply voltage from the half of 1990's and coming of next lower supply voltage than 3.3V. EIAJ 3.3V standard (EIAJ ED-5001), 2.5V standard

(EIAJ ED-5002) and 1.8V standard (EIAJ ED-5003) were enacted in May 1998, respectively. These standards correspond to that of JEDEC about specifications, but these are amended from that of JEDEC about notation and sentence for accomplishing unify of them among three JEDEC standards (3.3V, 2.5V, 1.8V).

Discussion of 1.5V standard has begun in JEDEC from September 1998, also EIAJ started at the same time. EIAJ gave it's comments to JEDEC draft, since December 1998. Especially, EIAJ carried out the questionnaire about need of wide range and confirmed necessity of wide range from it's results. JEDEC adopted EIAJ comment of wide range which wasn't included in first draft.

EIAJ standard of 1.5V power supply voltage was established in June 2000.

ED-5004A

This standard was composed of a normal range for regulated operation and a wide range for battery operation, supposing an age of $0.15\mu m$ class IC.

After standardizing the dc standard, discussion on Schmitt trigger input standard was started by JEITA / LVSC in February 2003. JEITA/LVSC submitted its proposed Schmitt trigger input standard to JEDEC in March 2004, for the first time. JEDEC's discussion on Schmitt trigger input standard was begun by this proposal. The task-group was organized by JEITA / LVSC and JEDEC at the JEDEC meeting in June 2004. It has decided that the proposal of Schmitt trigger standard to be added into existing dc standard. Finally, the proposal of Schmitt trigger input standard was approved at the JEDEC meeting in December 2004. Based on the result of JEDEC meeting, JEITA's revised standard of 1.5V power supply voltage was revised as ED-5004A in April 2006.

3. Members of discussion This standard has been discussed by the IC Low Voltage Operation Sub-committee which belongs to Group on Integrated Circuits of Technical Standardization Committee on Semiconductor Devices.

The members are shown as following.

< Technical Standardization Committee on Semiconductor Devices >

Chairman Hisao Kasuga NEC Electronics Corp.

< Group on Integrated Circuits >

Chairman Hisao Kasuga NEC Electronics Corp.

< IC Low Voltage Operation Sub-Committee >

Chairman Haruyoshi Takaoka Fujitsu Ltd.

Vice-chairman Kohji Hosokawa IBM Japan, Ltd.

Member Masahiro Kurimoto Oki Electric Industry Co.,Ltd.

Hidemitsu Baba SANYO Electric Co.,Ltd.
