Design guideline of integrated circuits for Plastic Shrink Small Outline Package (P-SSOP)

1. Scope of Application

This technical report regulated outline drawings and dimensions of the Plastic Shrink Small Outline Package (herein after referred to as P-SSOP), which terminal straight pitch $\square e$ is 1.00mm less than, among the packages classified as form B in the **EIAJ ED-7300** [Recommended practice on Standard for the preparation of outline drawings of semiconductor packages]

Note This technical report is revised and corresponds to **EIAJ ED-7311-20** [Standard of integrated circuits package (P-SSOP)] established in January 2002. The other relation standards are shown below.

EIAJ EDR-7320 [Design guideline of integrated circuits for small outline package (SOP)]
established in December 1998

EIAJ ED-7311-19 [Standard of integrated circuits package (P-SOP)] established in January 2002

EIAJ EDR-7312 [Design guideline of integrated circuits for thin small outline package (type I)
(TSOP I)] established in April 1996

EIAJ EDR-7313 [Design guideline of integrated circuits for thin small outline package (type II)
(TSOP II)] established in April 1996

EIAJ ED-7311-1 [Standard of integrated circuits package (TSOP(1))] established in August 1997

EIAJ ED-7311-2 [Standard of integrated circuits package (TSOP(2))] established in August 1997

2. Definition of the Technical Terms

The definition of the technical terms used in this technical report is in conformity with **EIAJ ED-7300**, and the definition of technical terms appearing a new are given within the text of this standard.

3. BACKGROUND

Recently, electronic appliance become smaller and thinner, on such background it is appearance the Plastic Small Outline Package (herein after referred to as P-SOP), terminal straight pitch $\square e$ is 1.27mm(50mil). And after that, Terminal straight pitch $\square e$ made shrink P-SSOP also became used. This technical report intended to standardize the outer dimensions of P-SSOP and ensure compatibility between products as far as possible for standardization.

4. Definition of P-SSOP

P-SSOP is defined as Form B with L terminal in the item 6, "Outline classification of shapes of semiconductor package " at the **EIAJ ED-7300**, and a package with formed terminals led out of longer side of itself in two directions, whose terminal pitch $\square e$ is 1.00mm or less, are flat toward the outside of the package body for mounting on print circuits board surface. (gull wing shape lead)

5. Numbering of Terminals

Numbering of terminals complies with the **EIAJ ED-7300**.

6. Nominal Dimensions

Package width X Package length(Symbol : $\square E$ X $\square D$) is applied to Nominal Dimensions.

However as the exception, old nominal dimensions is possible to use places (side by side) and it writes which Package width(Symbol : E).

EIAJ EDR-7314A

7. REFERENCE CHARACTERS AND DRAWING

7.1 Outline Drawing

Figure 1

Figure 2 Detail area of datum A

For even number of terminals on a package side

For odd number of terminals on a package side

Figure 3 Detail of terminal, terminal cross section

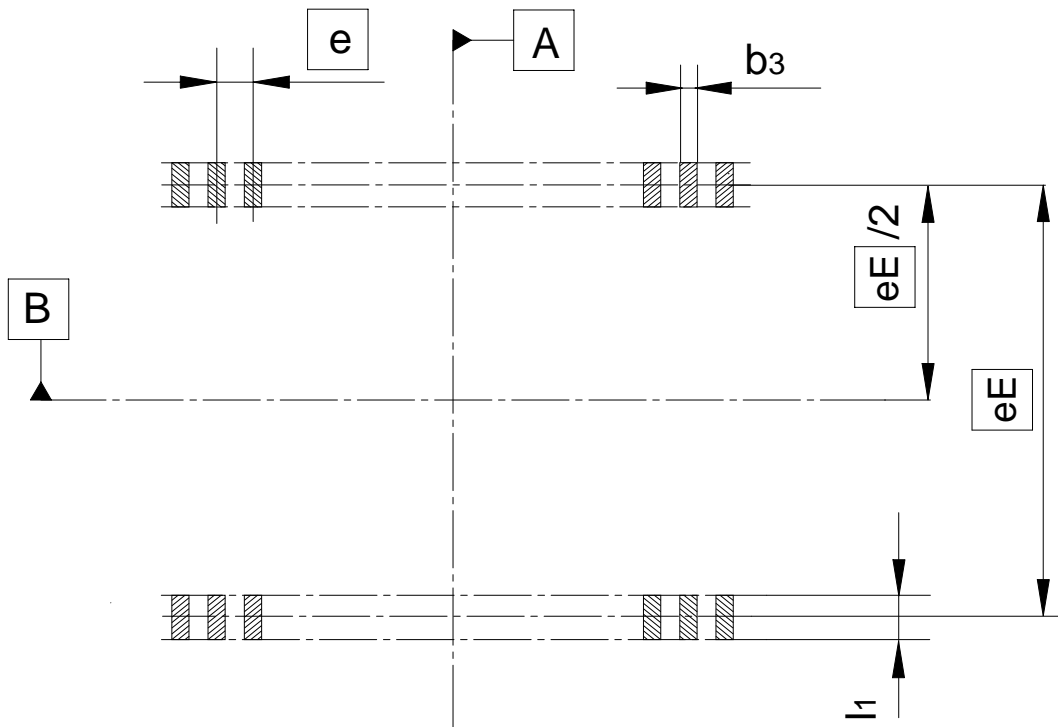

- Notes**
- (¹) The mounting surface, with which a package is in contact.
 - (²) The base surface, which is in parallel with the mounting surface and links the lowest point, except the stand-off.
 - (³) The maximum mounting conditions apply to the positional tolerance of the terminals.
(Refer to **ISO 2692/JIS B 0023**.)
 - (⁴) Specifies the true geometric position of the terminal axis.
 - (⁵) Shows the allowable position of the Index mark area, which is based on the IEC standard and basically 1/16 with package body size, however in case of small package body size, it is less than 1/4 with
 - (⁶) The dimensions of the terminal section apply to the terminal region ranges of 0.10mm and 0.25mm from the end of a terminal.
 - (⁷) Resin burrs and gate remains of the package sides with no terminals are max.0.15mm per side.
 - (⁸) Resin burrs of the terminal sides are max.0.25mm per side.

7.2 PATTERN OF TERMINAL AREAS

Pattern of terminal areas can exist is shown **Figure 4** as reference for the foot print design.

Figure 4

$$l1_{max} = L_{pmax} + t/2$$

$$b3_{max} = b_{pmax} + X$$

$$eE = H_E - L_{pnom}$$

EIAJ EDR-7314A

8. Outer Dimension

Table 1 below shows the standard dimensions. Combinations of the standard dimensions shown below allow a number of package variations. If a package is newly designed, their dimensions shall be selected in the 8.3 Table 2. Number of terminal list.

(²) The recommended number of terminals in a package length is the maximum number in the package length (D). (See "*" in Table 4)

EIAJ EDR-7314A

8.4 Standard Registration

When you need to register a new outline specification on the standard, complete the appendix format 5 in Technical Standardization Committee on Semiconductor Device Package steering rule, in compliance with the Standardization Rule. In order to make a package dimension table, which come under Item 2, Appendix format 5, fill the dimensions marked with (L) in the following Table.

Incidentally, it supposes that it enters package code form type according to **EIAJ ED-7303A** (Name and Code for Integrated Circuits Package).

EIAJ EDR-7314A

9.2 Relation of SOP, SSOP with Package length \square D, Package width \square E

Explanatory notes

1. PURPOSE

This technical report is intended to provide the industrial standards for shrink small outline packages (to be referred to as P-SSOP hereinafter) and the design guidelines in producing the P-SSOP and developing the automatic mounting machines and related parts.

2. PROGRESSES OF DELIBERATION

Along with a recent trend toward higher integration and higher function devices, larger dies and increase pin numbers have been requested, devices have been made smaller and lighter, and consequently, miniaturization of semiconductor packages is now indispensable. In order to meet these requests, the general rules for P-SSOP outlines, **EIAJ ED-7402-2**, were enacted and issued in February 1990 through deliberation by the Technical Committee on Semiconductor Package Outline (predecessor of Technical Standardization Committee on Semiconductor Device Package), apart from the conventional small outline packages (to be referred to as P-SOP hereinafter). After that, we examined the actually produced packages and found many inconsistencies with the general rules. Therefore, the P-SSOP General Rules Preparation Working Group in the Plastic Package Sub committee (predecessor of IC Package Sub Committee) revised them preponderantly since March 1992, and the revised rules, **EIAJ ED-7402-2A**, were enacted and issued in November 1993 through deliberation by the Special Technical Committee on Semiconductor Device Packages (predecessor of Technical Standardization Committee on Semiconductor Device Packages).

EIAJ ED-7402-2A was revised that an emphasis was placed on linking the package sizes to TSOP(2), main force of memory packages, as to large P-SSOP for memory which have been expected as future package line-up. This resulted in the general rules with two dimensional series; one is hard metric series (package width of less than 300 mil) considering actual package sizes based on the conventional **EIAJ ED-7402-2**, and soft metric series (package width of 300 mil or more) taking the thick TSOP(2) type as its concept.

Furthermore, in order to introduce postponed datum and coordinate with the JEDEC (Joint Electron Device Engineering Council) after enactment of the **EIAJ ED-7402-2A**, the Plastic Package Subcommittee (predecessor of IC Package Sub Committee) and P-SSOP Project Group started revision work since July 1995, putting emphases on review of proposed styles and clarification of location as design guide, considering standardization of the IEC (International Electro technical Commission) aiming at international standardization, as well as review of maximum number of terminals in each package length for the hard metric series and inclusion of 400 mil or more dimensions in the hard metric series for the soft metric series. And **EIAJ EDR-7314** was established in August 1996.

This technical report, **EIAJ EDR-7314A** is revised, the revision which is in the package outline drawing form to have conformed to the IEC standard after considering a consistence with **EIAJ ED-7311-20** [Standard of integrated circuits package (P-SSOP)] which was established in December 2001 in IC Package Sub Committee.

Furthermore, it added new Seated height cord "V" (VSSOP (Very thin SSOP): Seated height $A_{max}=1.00\text{mm}$), and "W" (WSSOP (Very Very thin SSOP): Seated height $A_{max}=0.80\text{mm}$). Also, it added an equal to or less than 3.00 mm area, package width (E), the package length (D) which to think that is increased in by the production in the future. This technical report, **EIAJ EDR-7314A** is established in January 2002 in IC Package Sub Committee.

EIAJ EDR-7314A

3. BASIC IDEA

(1) Datum

The datum and geometrical tolerances were adopted this technical report. In adopting the datum, we referred to the JEDEC standards for various packages, and registered packages. For the datum in package length, a point 0.10mm inside the terminal nose at the package center was set as datum target, sharing a tolerance for the terminal center position (X).

(2) Outer coating of the terminals

The terminal width and thickness, limited to solder plating. This technical report provides them for extremely thin plating such as palladium.

(3) Package outline drawing and Allowable range of soldering part of terminals

According to the IEC standard, As the rule with the terminal width (b_p) of Package outline drawing, it added to tolerance for terminal center position (X) and it gained means projected tolerance zone (P). It's meaning shows the range of the measurement object and guaranteeing the height of $A_3 = 0.25$. Also, it changes the symbol of Allowable range of soldering part of terminals into Terminal interval pitch(eE) from Overall width(H_E) and relation is $eE = H_E - L_{pnom}$.

4. BACKGROUND FOR DIMENSIONAL PROVISIONS

(1) Nominal dimensions

Package width X Package length(Symbol : $E \times D$) is applied to Nominal dimensions. However as the exception, old nominal dimensions is possible to use places (side by side) and it writes which package width (Symbol : E).

(2) Package width (E)

There are two hard metric series of package widths and lengths, and one soft metric series. Each series was grouped and its combinations were limited within the same group. One of large size hard metric series is 400mil or more dimensions in the soft metric series in the old **EIAJ ED-7402-2A** newly changed to the hard metric series, as same as SOJ, TSOP(2).Although resin burr between the terminals does not directly affect an outer dimension, it must be 0.25mm at maximum on single side from a viewpoint of unification of specification with the JEDEC.

EIAJ EDR-7314A

(3) Progresses of revisions Package width (Enom/ E)

ED-7404-2 1990.02	ED-7404-2A 1993.11	EDR-7314 1996.08	EDR-7314A 2002.01		
Enom	Enom		E

	Coordination with existing products	Inclusion in same system as TSOP(2)		Inclusion of 400mil or more in Hard Metric systems	
					It adds equal to or less than E=3.00 ranges.

Note Parenthesized Package widths are not recommended

(4) Package length(D)

At EIAJ EDR-7314, along with new inclusion of nominal dimensions and package widths in the hard metric series, a new package length series was added for 400 mil or wider packages. Since the resin burr or remainder of gate at the end face directly affects an outer dimension, they must be 0.15mm at maximum on single side (same specification as the JEDEC).

EIAJ EDR-7314 is added an equal to or less than 3.00 mm area, the package length (D) which to think that is increased in by the production in the future.

(5) Terminal width and thickness (b_p, b₁, c, c₁)

At EIAJ EDR-7314, In line with the QFP design guide, the minimum, normal, and maximum values for, e = 0.30 mm have been un-parenthesized. Also, the following ideas have been applied in order to deal with extremely thin plating (palladium) other than solder plating, for which a demand is expected to increase in the future.

Minimum value: A lower value for extremely thin plating has been adopted in orders to share the standards for solder plating and extremely thin plating.

$$b_{pmin} = b_{1min}, C_{min} = C_{1min}$$

Normal value: Divide because rough thickness values of solder plating and extremely thin plating differs from each other.

Solder plating: $b_{pnom} = b_{1nom} + 0.02$ (Plating thickness rough side 0.01)

$$C_{nom} = C_{1nom} + 0.02$$
 (Plating thickness rough side 0.01)

Extremely thin plating: $b_{pnom} = b_{1nom}, C_{nom} = C_{1nom}$

Maximum value: A higher value for solder plating has been adopted in order to share the standards for solder plating and extremely thin plating.

$$e = 1.00, 0.80, 0.65, 0.50\text{mm} : \text{Recommended values in EIAJ EDR-7314}$$

$$e = 0.40, 0.30\text{mm} : \text{Same values as QFP}$$

EIAJ EDR-7314A

Particularly, in case of $e = 0.30\text{mm}$ for the terminal width (b_p), and $c_{\text{nom}} = 0.15$ or 0.10 for the terminal thickness (c), the values calculated with square root of sum of squares of material tolerance and plating tolerance was raised to 2-digit values below decimal point, considering the respective tolerances independent (in order to include the recommended values in **EIAJ EDR-7314**).

(6) Allowable value for the terminal center position (x) and co planarity of the terminal bottom face (y)

In order to coordinate as same SOP (Small Outline Package) type packages,

$e = 1.00, 0.80, 0.65\text{mm}$: the regular value have been adjusted to TSOP(2)

$e = 0.50\text{mm}$: the regular value has been coordinated with the JEDEC standard

$e = 0.40, 0.30\text{mm}$: the regular value have been coordinated QFP with gull wind lead

(7) Number of terminals(n)

This design guide has divided package lengths (D) into three groups, 1 through 3, according to the package width(E) , and provided the minimum package overhangs for the respective groups to calculate the maximum number of terminals(= recommended number of terminals) in each package length. For Group1, part of the maximum numbers of terminals (= recommended numbers of terminals) differs from the maximum number of terminals calculated as described above, because it have been coordinated with the JEDEC standard.

In this design guide, the regular maximum number of terminals has been set to 120 obtained out of $e = 0.50\text{mm}$ at maximum package length $D = 30.75\text{mm}$. This has been determined in order to maximally make use of the regular number of terminals at terminal linear spacing $e = 0.50\text{mm}$, which is the current mainstream, on the assumption that the SOP type package will not greatly exceed 100 pins for the moment.

(8) Package overhang(Z_D)

(a) Group1

This group, equivalent to a small package group, wants to take as many terminals as it can. Particularly in case of $D \leq 14.00\text{mm}$, the distance from the terminal end at the package corner to the package end has been set to 0.10mm which is a currently possible physical limit value, and limited by;

$$Z_D \geq 0.10 + b_{1\text{nom}}/2$$

In case of $D > 14.00\text{mm}$, the distance from the terminal end at the package corner to the package end has been set to 0.20mm , considering chipping of the package, and limited by;

$$Z_D \geq 0.20 + b_{1\text{nom}}/2$$

(b) Group2, 3

Since the package width and length are the same as SOJ and TSOP(2), the number of terminals has been also limited in the same manner as in case of SOJ and TSOP(2), as far as $e = 1.00, 0.80, 0.65$ or 0.50mm . ($Z_D \geq 0.50\text{mm}$) For the terminal linear spacing $e = 0.40$ or 0.30mm , which has not been provided in SOJ or TSOP(2), the same limitations as those in case of Group1, $D > 14.00\text{mm}$ have been applied.

(9) Terminal flat section length, terminal length, and terminal soldering section length (L, L_1, L_p)

The old **EIAJ ED-7402-2A** uniformly provided " $L/L_1 = 0.50/1.00$ " regardless of the package size, but later, installation strength was judged insufficient with the packages in the soft metric series(large package group). Therefore, only in case of the body height of $A_{2\text{nom}} = 2.70\text{mm}$ where reduced installation strength was particularly pointed out at " $L/L_1 = 0.50/1.00$," from old **EIAJ EDR-7314** has adopted " $L/L_1 = 0.80/1.60$ " which has a good track record of installation strength.

EIAJ EDR-7314A

And this design guide **EIAJ EDR-7314A** is adopted " $L/L_1 = 0.30/0.50$ " in the case below package width $E=3.00\text{mm}$, it corresponded to made smaller of a package.

Due to new introduction of soldering section length of L_p in the old **EIAJ ED-7402-2A** in line with the IEC format, the conventional terminal flat section length L has been changed from the foreign assurance value (dimension with tolerance) to the dimension used only for package design (dimension without tolerance), and so has the terminal length L_1 due to new introduction of the datum and geometrical tolerance in this design guide.

(10) Terminal first bent spacing (G_{1E})

From old **EIAJ EDR-7314**, As with QFP, it was added nominal values of terminal first bent spacing for reference of test sockets and tray design.

5. PACKAGE NAMES

According to the package height code which was established in the **EIAJ ED-7303A** and IEC format, thin body type SSOP made the name which is with low seated height, It inewly added VSSOP (Very thin SSOP), WSSOP (Very Very thin SSOP) in addition to LSSOP (Low profile SSOP), TSSOP (Thin SSOP) from this design guide. Seated height (A) and (A_{2nom}) are shown below.

LSSOP(Low profile SSOP) :seated height $A_{max}=1.70\text{mm}$, $A_{min} > 1.20\text{mm}$, body height $A_{2nom}=1.40\text{mm}$
TSSOP(Thin SSOP) :seated height $A_{max}=1.20\text{mm}$, $A_{min} > 1.00\text{mm}$, body height $A_{2nom}=1.00\text{mm}$
VSSOP(Very thin SSOP) :seated height $A_{max}=1.00\text{mm}$, $A_{min} > 0.80\text{mm}$, body height $A_{2nom}=0.80\text{mm}$
WSSOP(Very Very thin SSOP) :seated height $A_{max}=0.80\text{mm}$, $A_{min} > 0.65\text{mm}$,
body height $A_{2nom}=0.60\text{mm}$

EIAJ EDR-7314A

COMMITTEE MEMBERS

The IC Package Subcommittee of the Technical Standardization Committee on Semiconductor Device Packages has mainly deliberated this standard.
The subcommittee members are shown below.

<Technical Standardization Committee on Semiconductor Device Package>

Chairman ELPIDA MEMORY, INC. Ichiro Anjo

< IC plastic Package Subcommittee>

Chief SANYO ELECTRIC CORP. Hideyuki Iwamura

Co- chief SHARP CORP. Katuyuki Tarui

FUJITSU LTD. Hiroshi Inoue

TOSHIBA CORP. Yasuhiro Koshio

MATSUSHITA ELECTRIC INDUSTRIAL CO., LTD. Toshiyuki Fukuda

Members AMKOR THECHNOROLOGY JAPAN. INC. Naomitchi Syoji

ENPLAS CORP. Yoshiyuki Ohashi

ENPLAS CORP. Hisao Oshima

ELPIDA MEMORY, INC. Fumitake Okutsu

OKI ELECTRONICS INDUSTRY CO., LTD. Kazuhiko Sera

KYOCERA CORP. Akihiro Funahashi

KOGUNEX Takahiro Aoki

SANYO ELECTRIC CORP Kiyoshi Mita

SUMITOMO 3M CORP. Akiko Tsubota

SEIKO EPSON CORP. Yoshiaki Emoto

SONY CORP. Hiroshi Abe

TOSHIBA CORP Morihiro Ikemizu

NEC CORP. Kenichi Kurihara

NEC CORP. Kaoru Sonobe

IBM JAPAN CORP. Tuneo Kobayashi

TEXAS INSTRUMENTS JAPAN LTD. Takayuki Ohuchida

HITACHI LTD. Yoshinori Miyaki

HITACHI Cable LTD. Tadashi Kawanobe

FUJITSU LTD. Kaoru Tachibana

FUJI ELECTRIC CO., LTD. Osamu Hirohashi

MATSUSHITA ELECTRIC INDUSTRIAL CO., LTD. Tomoki Tamaki

MITSUBISHI ELECTRIC CORP. Kazuya Fukuhara

MELCO INC. Tsuneo Watanabe

YAMAICHI ELECTRIC CO., LTD. Noriyuki Matsuoka

UNITECHNO INC. Hitoshi Matsunaga

ROHM CO., LTD. Osamu Miyata

Special Members SHIN-ETSU POLYMER Ken Tamura

TOYOJUSHI CO., LTD. Hitoshi Kazuma
